Algorithm

1.Start

2.Input the values start and stop.

3.Set found = False.

4.Repeat for each number num from start to stop.

5.Check if num > 1.

6.Repeat for i from 2 to √num.

7.Check condition:

If num % i == 0 → break (number is not prime).

8.If no divisor is found, then:

Print num

Set found = True.

9.After the loop, check found.

10.If found == False → Print "No primes".

11.Stop

8.1.2. Prime Numbers in a Given Range
00:15
Write a Python program to print all prime numbers within a given range (inclusive of both start and end values).
Input Format:
• First line contains an integer representing the start of the range.
• Second line contains an integer representing the end of the range.
Output Format:
• Print all prime numbers in the given range (including start and end if they are prime). Print each prime number on a separate line.
• If no prime numbers exist in the range, print: "No primes".
