

9.1.1 Count Vowels in a String-1

Algorithm

Step 1: Start

Step 2: Input a string and remove extra spaces using `strip()`

Step 3: Store all vowels in a variable ("aeiouAEIOU")

Step 4: Initialize `count = 0`

Step 5: Traverse each character in the string

Step 6: Check if the character is a vowel

Step 7: If yes, increment `count` by 1

Step 8: Repeat steps 5–7 until all characters are checked

Step 9: Print the value of `count`

Step 10: Stop

Flowchart

9.1.1. Count Vowels in a String - 1

Write a program that takes a string as input and prints the total count of vowels in that string. Consider both uppercase and lowercase.

Input Format:

- A single line contains a string that may contain letters, numbers, and punctuation.

Output Format:

- An integer representing the total number of vowels in the input string.

Sample Test Cases

+

vowel_co...

```
1 st=input()
2 count=0
3 for i in st:
4     if i in ('A','E','I','O','U','a','e','i','o','u'):
5         count+=1
6 print(count)# Type Content here...
```
